

# Fatigue Risk Management in NATS

Neil May  
Head of Human Factors and Chair of the NATS Fatigue Risk Management Steering  
Group  
FRMS Forum,  
7 – 8 April, 2016

# En-route ATC

## Prestwick

Handles on average 2,500 flights/day

Scottish Oceanic Control Centre

Scottish Area Control Centre

Manchester Area Control Centre

## Swanwick

Handles on average 5,500 flights/day

London Area Control Centre

London Terminal Control Centre

London Military Air Traffic Control

**NATS**

# Airport ATC

> 13 major UK airports

> Gibraltar

> 9 airports in Spain

# A Suite of Fatigue Management Manuals

**The Manual  
for the  
Oversight of  
Fatigue  
Management  
Approaches  
(Doc. 9966)**

**Fatigue Management  
Guide for Operators  
(IATA/ICAO/IFALPA)**

Annex 6, Part I

**Fatigue Management Guide  
for GA Operators of Large and  
Turbojet Aeroplanes  
  
(IBAC/ICAO/FSF)**

Annex 6, Part II

**Fatigue Management  
Guide for Air Navigation  
Service Providers**

Annex 11

Extended  
to include  
ANSPs

New

## Air Navigation Service Provider Responsibilities

- Implement work schedules that enable Air Traffic Controllers to perform their duties safely
- Provide a working environment that has appropriate emphasis on controls and/or mitigations for fatigue-related risk
- Provide adequate opportunities for rest and sleep
- Provide fatigue management education and awareness training for all stakeholders
- Have a process for monitoring and managing fatigue

## Air Traffic Controller Responsibilities

- Arrive for work fit for duty
- Make appropriate use of non-controlling periods (both between duty periods and during a duty period)
- Manage own fatigue levels
- Report fatigue issues

## Prescriptive Limitations

The UK has a Scheme for the Regulation of Air Traffic Controllers Hours (SRATCOH) published by the UK CAA as CAP 670

- The prescriptive limitations can be found in Part D, Section 2

Its purpose is to:

“ensure, as far as is reasonably possible, that controller fatigue does not endanger aircraft and thereby to assist controllers to provide a safe and efficient service”

## SRATCOH sets Prescriptive Limitations for

- Periods of duty
- Intervals between periods of duty
- Consecutive periods of duty
- Operational duty
- Night duty
- On call duty
- Early starts
- Morning duty
- Holidays

## Local Agreements and Actual Practice

SRATCOH provides generic, maximum limitations

Each part of our operation also has local agreements which are equal to or more restrictive than SRATCOH

These take into account what a controller in that part of the operation actually does

Supervisors make on-going tactical decisions based on current and predicted controller workload and who they have available.

How many sectors need to be open?

How busy is an individual controller?

## Example for a Busy London Sector

### SRATCOH

- “No operational duty shall exceed a period of **two hours**”

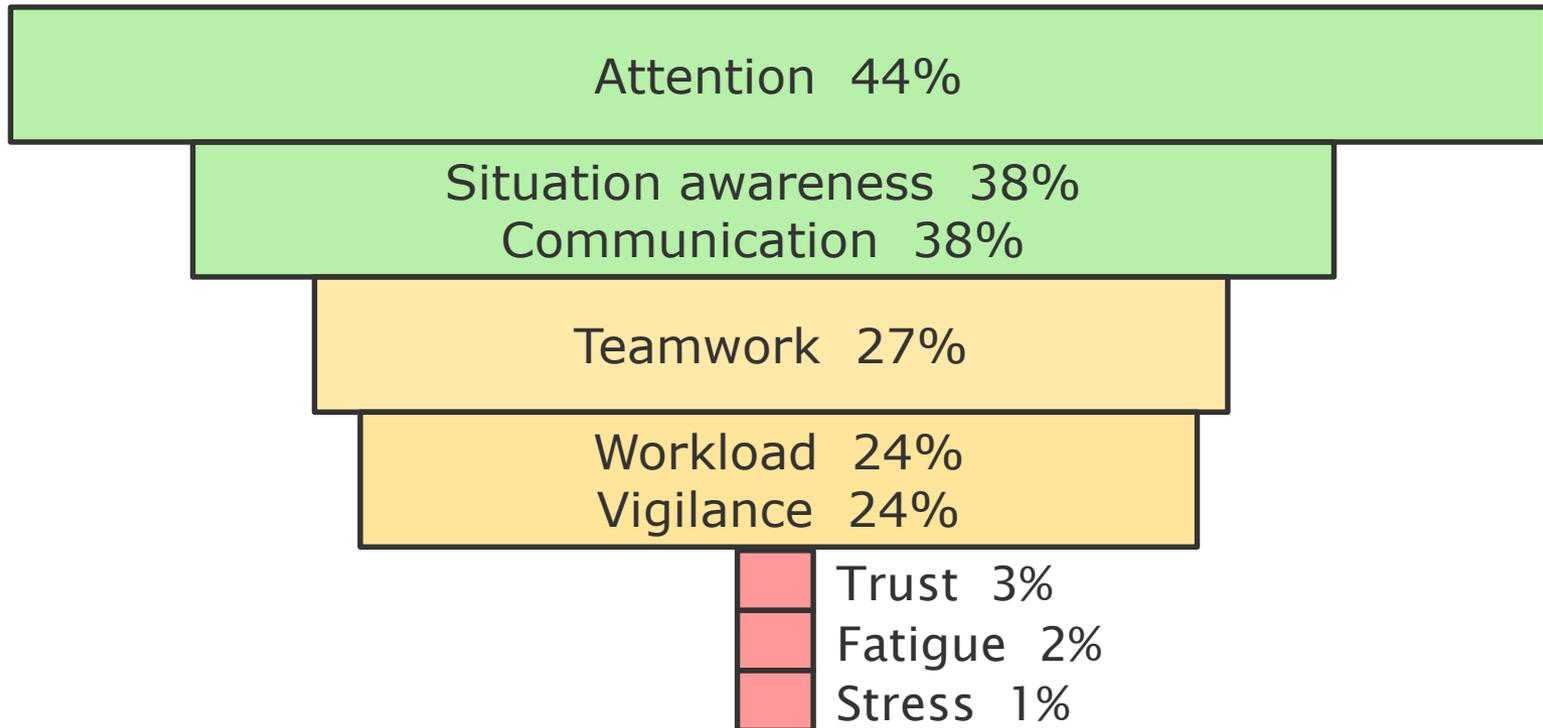

### Local Agreement

- No operational duty shall exceed a period of **90 minutes**

### Actual Practice

- At busy times, controllers work for around **60 minutes**

# Factors Contributing to Air Traffic Control Incidents in Europe

## Fatigue Reporting in NATS

NATS has a good safety reporting culture

- Over the last 5 years, there have been no safety incident reports where fatigue has been identified as a causal factor
- Does that confirm that we are managing fatigue effectively?
- Should we be worried?

## Awareness Training and Workshops

Awareness training was provided and workshops were held with controllers to highlight:

- The signs of fatigue in themselves and their colleagues
- Tips and techniques for avoiding / managing fatigue
- What to do if fatigue is identified

# Awareness Training and Workshops

Stories and anecdotes were shared

“I’ve never been fatigued at work  
but I have a friend who ...”

**A Lifestyle to Reduce Fatigue**

### Why Fatigue Affects People Differently

Fatigue affects people in different ways. Recognising this should help you to recognise your own lifestyle challenges. Here are a few factors to consider from the research.

Click on each item to find out more.

- Younger people
- Older people
- Day people and night people

**Day people and night people**

Some people seem to feel more alert early in the day – these are known as 'larks'. The opposite type – the 'owls' – prefer to stay up later at night.

This can have an influence on which shifts a person prefers or finds hardest.

## Measuring Fatigue

### Method used

- Electronic data collection via touchscreens
- Subjective, self-reporting scale (Samn-Perelli (1982))
- Completed post- shift

# Measuring Fatigue - Results

## Objective Measurements

Can we collect objective measures of fatigue and correlate them to the subjective measures?

## Conclusions

Do we have a problem with fatigue in NATS?

- No – there is good evidence that fatigue risk is being managed effectively
- But - we should not be complacent, as fatigue can reduce people's performance

What are our priorities?

- Improve reporting
- Investigate how to collect objective measures of fatigue automatically
